

Project: Java and Web Development

Hospital Appointment Management System

Jose Esteban Vasquez Barboza

Use cases

The project will be a web application designed to manage the appointments of a Hospital. The purpose is to manage the registration of Clients and Doctors in to the system, as well as the scheduling of appointments.

The target user group is both private and public hospitals and clinics.

The actors and use cases of the system are:

Client: the client of the application, who will make the appointments. Its use cases are as follows:

- Register in the system.
- Log in to the system.
- Update user data.
- View available dates/hours for appointments.
- Schedule an appointment for an available date/hour.
- Modify scheduled appointments.
- Cancel scheduled appointments.

Doctor: its use cases are as follows:

- View all patients who have had appointments.
- View patient appointment history.

Admin: its use cases are as follows:

- Accepts user registration in the system.
- Registers new doctors in the system.
- Modifies user's/doctor's data.
- Deletes users/doctors from the system.

Technologies

The following technologies will be used:

- **Backend:** Java, Spring Boot.
- **Frontend:** JavaScript, TypeScript, React, Vite, and Tailwind CSS.
- **Database:** MariaDB.
